Lineament Groups

17a — Lineament group mapped for this study coinciding with previously mapped fault or lineament

25 — No previously mapped fault or lineament coincides with lineament group

Attribute	Cross Section Morphology*	Description	Examples
1		Linear break-in-slope bisecting a planar surface	Uphill- or downhill-facing scarps, ateral moraines or kame deposits along lateral margins of valley glaciers
2		Abrupt changes in slope adjacent to otherwise relatively horizontal (and planar) surfaces	Linear range fronts, faceted ridges, terrace risers, steep downstream faces of rouche mountonees
3		Linear U-shaped trough	Glacial valleys, ice-scoured flutes, flood-scoured flutes,
4		Linear V-shaped trough	Active stream channels
5		Linear ridges	Drumlins, water-scoured terrain, eskers
6 (also 77)	n/a	A series of aligned features	Could include attributes #1 -5 above and/or aligned saddles, tonal lineaments, etc.
66	n/a	Data artifacts	Linear seams between data sets collected on different dates
88	n/a	A series of aligned features, which are too small to individually map at the given scale	Could include features with attributes #1-5 above and/or aligned saddles, tonal lineaments, etc.
99	n/a	A line which encloses a broad expanse of features all having the same orientation	An area of jointing or of glacial striae all having the same, parallel orientation
10	n/a	Anthropogenic lineaments	Roads, rail roads, power lines and other linear clearings, etc.

Notes: *Arrow points to location of the mapped feature.

Explanation for relevant geologic units of Williams and Galloway (1986) shown on Figure A20.5 and A23.1

Geologic Units

Bottom deposits of 914 - 975 m lake
Overprint denoting glacial drift that is mantled by bottom sediments of glacial lake that extended to 914 - 975 m abovemodern sea level, largely confined to middle Susitna valley, above ice dam below Fog Lake (off map) and apparently bounded on east and south side by glacier ice. Does not cover late(st) Wisconsin (last major) morainal systems. No shoreline features are mapped.

Bottom deposits intermediate (777 - 747) lake
Overprint denoting bottom deposits of a local lake that covered melting glacier ice between Tyone Lake and Lake Louise, apparently behind Tyone Spillway, and drained as the elevation of the spillway was cut down from 777 m to 747 m above sea level while stagnant ice was still in valley bottom.

Bottom deposits of last regional lake
Overprint denoting drape of bottom deposits over drift and thick lake sediments that persisted in Copper River drainage basin from just before deposition of Old Man moraines to a time when glaciers had retreated to within 16 to 24 km of present glaciers: older than 13,000 years.

Symbols

AA — Location and letter designation of radiocarbon-dated stratigraphic section in accompanying text.

Ice boundary, morainal ridge, kame terrace, delta, or other ice contact feature marking edge of glacier: hachures toward glacier.

Shoreline of regional lake: mapped for the lake in Copper River basin where at 747 m (maximum elevation); the elevation to which Tyone Spillway was eroded, and successively lower levels in the northern part of area between 747 m and 701 m above sea level. Lesser recessional shorelines mapped by Nichols and Yehle (1969) not shown.

Upper limit of post-glacial (Holocene, in part) shoreline of Tazlina Lake from elevation 564 m down to present lake level 544 m caused by lowering of lake as Tazlina River has deepened its canyon.

d — Delta of glacial lake, including those of modern glacial lakes such as Tazlina Lake.

Linear or drumlinoid feature, due to ice scour, direction of ice movement indicated by arrow.

Spillway for glacial meltwater, including that stored in large glacial lakes.

Contact between map units where not glacial boundary, most commonly between different levels of lake deposits.

D / U — Active (?) fault, lower Sonona Creek, offsetting unconsolidated deposits.

Location of selected erratic boulders, mountain top erratic stones transported by glaciers, e.g. Sheep Mountain; many occurrences on mountains lower than 1829 m not shown.

This explanation applies to all figures and plates in Appendix A.

Geologic Units from OFR 09-1108 (Wilson et al., 2009)

Water, ice field, or glacier

Unconsolidated Deposits

- Qs — Surficial deposits, undivided
- Qat — Alluvium along major rivers and in terraces
- Qlc — Landslide and colluvial deposits
- Qm — Glacial deposits, undivided
- Qhg — Young moraine deposits
- Qg — Major moraine and kame deposits
- Qgc — Glacioalluvium
- Qgo — Outwash in plains, valley train, and fans
- Qge — Glacioestuarine deposits

Sedimentary Rocks

- Tsu — Sedimentary rocks, undivided
- Tkn — Kenai Group, undivided
- Tts — Tsadaka Formation
- Tch — Chickaloon formation
- Km — Matanuska formation
- KJs — Turbiditic sedimentary rocks of the Kahiltna flysch sequence
- Jtxc — Undivided Chinitna and Tuxedni formations
- Jn — Naknek Formation, undivided
- Jtk — Talkeetna Formation, undivided
- JTrlm — Limestone and Marble
- Pe — Eagle Creek Formation, marine argillite and limestone

Igneous Rocks

Volcanic and Hypabyssal Rocks

- Tvu — Tertiary volcanic rocks, undivided
- Tfv — Felsic volcanic and sub-volcanic rocks
- Tem — Mafic volcanic rocks
- TKd — Dikes and sills
- Trn — Nikolai Greenstone and related rocks
- Pzv — Slana Spur Formation, volcaniclastic rocks
- Pat — Station Creek Formation andesitic volcanic rocks

Plutonic Rocks

- Ti — Intrusive rocks, undivided
- Toegr — Granitic rocks
- Tpgr — Granitic rocks of Paleocene age
- Tgd — Biotite-hornblende-granodiorite
- TKg — Granitic rocks, undivided
- TKgd — Granodioritic rocks
- Kgd — Granodiorite
- Jtr — Trondhjemite
- JPaur — Diorite, gabbro, picrite, and pyroxenite sill and dike swarm complex
- Jqd — Quartz diorite, tonalite, and diorite
- Jqm — Granodiorite and quartz monzonite

Melange and Metamorphic Rocks

- TKgg — Gneiss
- Jpmu — Plutonic and metamorphic rocks, undifferentiated
- JPam — Amphibolite
- JPmb — Marble
- Trnm — Metabasalt and slate
- TrPavs — Basaltic to andesitic metavolcanic rocks
- PPast — Metamorphosed Skolai Group

Note: For full explanation of geologic units see USGS OFR 09-1108 and USGS OFR 98-133.

Geologic Units from OFR 98-133 (Wilson et al., 1998)

- g — Ice fields or glaciers
- Water
- Qs — Surficial deposits, undifferentiated
- Tvu — Tertiary volcanic rocks, undivided
- Thf — Hypoabyssal felsic and intermediate intrusions
- Tiv — Granitic and volcanic rocks, undivided
- Tegr — Granite and granodiorite
- Mzpca — Phyllite, pelitic schist, calc-schist, and amphibolite of the MacLaren metamorphic belt
- Kgu — Granitic rocks
- KJf — Kahiltna flysch sequence
- Trcs — Calcareous sedimentary rocks
- Trnm — Metavolcanic and associated metasedimentary rocks

Tectonic Features from WCC report (WCC, 1982)

- Detailed feature, from site-specific maps
- Regional feature, from small-scale maps

For completeness, features from both regional and detailed scale figures have been included. The location of regional features may not always be accurate and the detailed features may be limited to the extent shown on original figures.

T-2 — Location of trench T-2 (shown on Figures A14 and A16)

Faults Compiled by FCL (Wilson et al., 1998; Wilson et al., 2009; Williams and Galloway, 1986; Clautice, 1990; Clautice, 2001; Csejtey, 1978; Kachadoorian, 1979; Smith, 1988)

- Fault, approximate
- Fault, inferred or queried
- Fault, certain
- Fault, concealed
- High-angle reverse fault, approximate
- High-angle reverse fault, certain
- High-angle reverse fault, concealed
- High-angle reverse fault, inferred or queried
- Thrust fault, approximate
- Thrust fault, certain
- Thrust fault, concealed
- Lineament

Hydrographic Features from National Hydrography Dataset, 2000, 1:24,000 scale

- Stream
- Ice mass
- Lake or pond

Other Items

- B — Location of photograph taken during 2013 field reconnaissance, labeled with photo ID and showing view direction
- 116 — GPS waypoint
- GPS track line, July 2013

Lineament Groups

17a — Lineament group mapped for this study coinciding with previously mapped fault or lineament

25 — No previously mapped fault or lineament coincides with lineament group

Attribute	Cross Section Morphology*	Description	Examples
1		Linear break-in-slope bisecting a planar surface	Uphill- or downhill-facing scarps, ateral moraines or kame deposits along lateral margins of valley glaciers
2		Abrupt changes in slope adjacent to otherwise relatively horizontal (and planar) surfaces	Linear range fronts, faceted ridges, terrace risers, steep downstream faces of rouche mountonees
3		Linear U-shaped trough	Glacial valleys, ice-scoured flutes, flood-scoured flutes,
4		Linear V-shaped trough	Active stream channels
5		Linear ridges	Drumlins, water-scoured terrain, eskers
6 (also 77)	n/a	A series of aligned features	Could include attributes #1 -5 above and/or aligned saddles, tonal lineaments, etc.
66	n/a	Data artifacts	Linear seams between data sets collected on different dates
88	n/a	A series of aligned features, which are too small to individually map at the given scale	Could include features with attributes #1-5 above and/or aligned saddles, tonal lineaments, etc.
99	n/a	A line which encloses a broad expanse of features all having the same orientation	An area of jointing or of glacial striae all having the same, parallel orientation
10	n/a	Anthropogenic lineaments	Roads, rail roads, power lines and other linear clearings, etc.

Notes: *Arrow points to location of the mapped feature.

Explanation for relevant geologic units of Williams and Galloway (1986) shown on Figure A20.5 and A23.1

Geologic Units

Bottom deposits of 914 - 975 m lake
Overprint denoting glacial drift that is mantled by bottom sediments of glacial lake that extended to 914 - 975 m abovemodern sea level, largely confined to middle Susitna valley, above ice dam below Fog Lake (off map) and apparently bounded on east and south side by glacier ice. Does not cover late(st) Wisconsin (last major) morainal systems. No shoreline features are mapped.

Bottom deposits intermediate (777 - 747) lake
Overprint denoting bottom deposits of a local lake that covered melting glacier ice between Tyone Lake and Lake Louise, apparently behind Tyone Spillway, and drained as the elevation of the spillway was cut down from 777 m to 747 m above sea level while stagnant ice was still in valley bottom.

Bottom deposits of last regional lake
Overprint denoting drape of bottom deposits over drift and thick lake sediments that persisted in Copper River drainage basin from just before deposition of Old Man moraines to a time when glaciers had retreated to within 16 to 24 km of present glaciers: older than 13,000 years.

Symbols

AA — Location and letter designation of radiocarbon-dated stratigraphic section in accompanying text.

Ice boundary, morainal ridge, kame terrace, delta, or other ice contact feature marking edge of glacier: hachures toward glacier.

Shoreline of regional lake: mapped for the lake in Copper River basin where at 747 m (maximum elevation); the elevation to which Tyone Spillway was eroded, and successively lower levels in the northern part of area between 747 m and 701 m above sea level. Lesser recessional shorelines mapped by Nichols and Yehle (1969) not shown.

Upper limit of post-glacial (Holocene, in part) shoreline of Tazlina Lake from elevation 564 m down to present lake level 544 m caused by lowering of lake as Tazlina River has deepened its canyon.

d — Delta of glacial lake, including those of modern glacial lakes such as Tazlina Lake.

Linear or drumlinoid feature, due to ice scour, direction of ice movement indicated by arrow.

Spillway for glacial meltwater, including that stored in large glacial lakes.

Contact between map units where not glacial boundary, most commonly between different levels of lake deposits.

D / U — Active (?) fault, lower Sonona Creek, offsetting unconsolidated deposits.

Location of selected erratic boulders, mountain top erratic stones transported by glaciers, e.g. Sheep Mountain; many occurrences on mountains lower than 1829 m not shown.

DRAFT

FUGRO Date 01/06/14	STATE OF ALASKA ALASKA ENERGY AUTHORITY ALASKA ENERGY AUTHORITY	SUSITNA-WATANA HYDROELECTRIC PROJECT STRIP MAPS EXPLANATION 2 OF 4	FIGURE A0.3

Explanation for relevant geologic units of Smith et al. (1988) shown on Figure A21b.1

UNCONSOLIDATED DEPOSITS

Alluvial deposits

Qa — FLOODPLAIN ALLUVIUM - Unconsolidated deposits in modern stream drainages. Material ranges from coarse, unsorted gravel in highland valleys to finely bedded silt in large river drainages.

Glacial deposits

Qdt_3 — TILL OF LATE WISCONSIN AGE - 11,800 to 25,000 yr B.P.

Qdt_2 — TILL OF EARLY WISCONSIN AGE - 40,000 to 75,000 yr B.P.

Ks — SCHIST - Medium- to coarse-grained biotite-plagioclase-quartz schist with local garnet and feldspar porphyroblasts to 0.5 mm. Dominantly gray or brown weathering. Includes local horizons that contain randomly oriented hornblende on foliation surfaces. Stippled pattern near intrusive contacts indicates hornfelsed zone in schist. K-Ar age of 57.2 m.y. was obtained from biotite in this unit in the adjacent Healy A-1 Quadrangle (Smith, 1981).

Kp — PHYLLITE - Silver-gray, biotite-bearing phyllite with biotite porphyroblasts to 2mm long; locally calcareous. Minor compositional banding with more quartzose layers parallel to foliation. Biotite yielded K-Ar age of 53 ± 1.6 m.y. (loc. 3 on map; Turner and Smith, 1974). Grades into ampbibole-bearing phyllite (Khp) unit.

Khp — AMPHIBOLE-BEARING PHYLLITE - Medium to dark gray spotted phyllite with planar laminations. Spotted with porphyroblastic biotite. Interlayered with beds that contain randomly oriented amphibole on foliation surfaces. Amphibole prisms commonly 0.5 to 3 mm long. K-Ar age of actinolitic hornblende from this unit in Healy A-I Quadrangle is 64.1 m.y. (Smith, 1981).

MAP SYMBOLS

Contact - dashed where approximately located ; dotted where concealed; queried where inferred

U / D — High-angle fault - dashed where approximately located; dotted where concealed; queried where inferred. D, downthrown side; U, upthrown side

35 — Thrust fault - dashed where approximately located. Sawteeth on upper plate. Arrow indicates dip of fault

L — Lineament - inferred from aerial photographs, may represent fault

Modified from selected portion of Smith et al. (1988) explanation

Explanation for relevant geologic units of Reger (1990) shown on Figure A21a.2

GLACIAL LIMITS

Glaciation of unassigned age, dashed where discontinuously mapped

Glaciation of Illinoian age, dashed where discontinuously mapped

Glaciation of late Wisconsin age, dashed where discontinuously mapped

Glaciation of Holocene age, dashed where discontinuously mapped

OTHER FEATURES

Prominent meltwater drainage channel

B — Radiocarbon sample locality

PROMINENT WAVE-CUT SCARPS

3,700-ft (1,120-m) lake, dashed where discontinuously mapped, dots on descending scarp

3,650-ft (1,110-m) lake, dashed where discontinuously mapped, open triangles point down descending scarp

FUGRO Date 10/18/13	STATE OF ALASKA ALASKA ENERGY AUTHORITY ALASKA ENERGY AUTHORITY	SUSITNA-WATANA HYDROELECTRIC PROJECT STRIP MAPS EXPLANATION 3 OF 4	FIGURE A0.4

Explanation for relevant geologic units of Grantz (1960) shown on Figure A20.1

Explanation

Geologic Units

Bar beneath letter symbol indicates map units identified on aerial photographs or from distant views (Tf, Qd, etc.)

QUATERNARY

Pleistocene and Recent

- **Qrg** — Rock glaciers
- **Qal** — Alluvial deposits
- **Qtc** — Talus and colluvium
- **Qls** — Landslide deposits
- **Qg / Qgd / Qgo** — Glacial deposits
  - Qg, *moraine, outwash, and proglacial lake deposits*
  - Qgd, *proglacial lake delta deposits*
  - Qgo, *stratified gravel, probably outwash deposits older than the last major glaciation*
- **Qd** — Surficial deposits, undifferentiated

UNCONFORMITY

TERTIARY

Eocene

- **Tf** — Fluviatile conglomerate and coaly sandstone

UNCONFORMITY

CRETACEOUS

Upper Cretaceous(?)

- **Km** — Matanuska formation(?) *Siltstone and shale*
- **Kcc** — Cobble conglomerate

UNCONFORMITY(?)

WESTERN PART OF AREA

Lower Cretaceous

- **Kc** — Calcareous sandstone, siltstone, and claystone
- **Kn** — Nelchina limestone *A calcarenite*
- **Ks** — Sandstone, locally conglomeratic and coquinoid to west, siltstone and claystone

EASTERN PART OF AREA

- **Knu** — Calcareous sandstone, siltstone, and claystone

UNCONFORMITY

JURASSIC

Upper Jurassic

- **Jnbs / Jns / Jnbsm / Jnc / Jnbc** — Naknek formation
  - Jnbs *and* Jnbsm, *biotitic sandstone and siltstone with coquinoid beds;*
  - Jns, *siltstone and shale with limestone concretions;*
  - Jnbc, *cobble and boulder conglomerate at base of formation;*
  - Jnc, *cobble and boulder conglomerate above base of formation*

UNCONFORMITY

Upper Jurassic

- **Jcsl / Jcs** — Chinitna formation
  - Jcsl, *siltstone and shale with limestone concretions;*
  - Jcs, *sandstone and siltstone*

Middle or Upper Jurassic

- **Js** — Sandstone *Sandstone, siltstone, and conglomerate with fossil wood fragments, and many mollusk shells in some beds. Equivalent to, or only slightly older than* Jcs

UNCONFORMITY

Middle Jurassic

- **Jt** — Tuxedni formation *Sandstone with calcareous concretions and some siltstone and shale*

UNCONFORMITY

Lower Jurassic

- **Jtk** — Talkeetna formation *Lavas and pyroclastic rocks of intermediate composition, sandstone, and argillite, all dominantly marine. Sedimentary rocks become dominant in upper part of the formation*

Lineaments, Faults, Contacts, Synclines, and Anticlines

- Anticline, dashed where approximate, dotted where concealed
- Contact; solid where certain, dashed and queried where uncertain
- Fault; solid where certain, dashed and queried where uncertain, dotted where concealed
- Lineament, approximate
- Syncline, approximate

79_218900_Alaska_Railbelt/2189_Lineament Report October 2013, modified 10.18.13

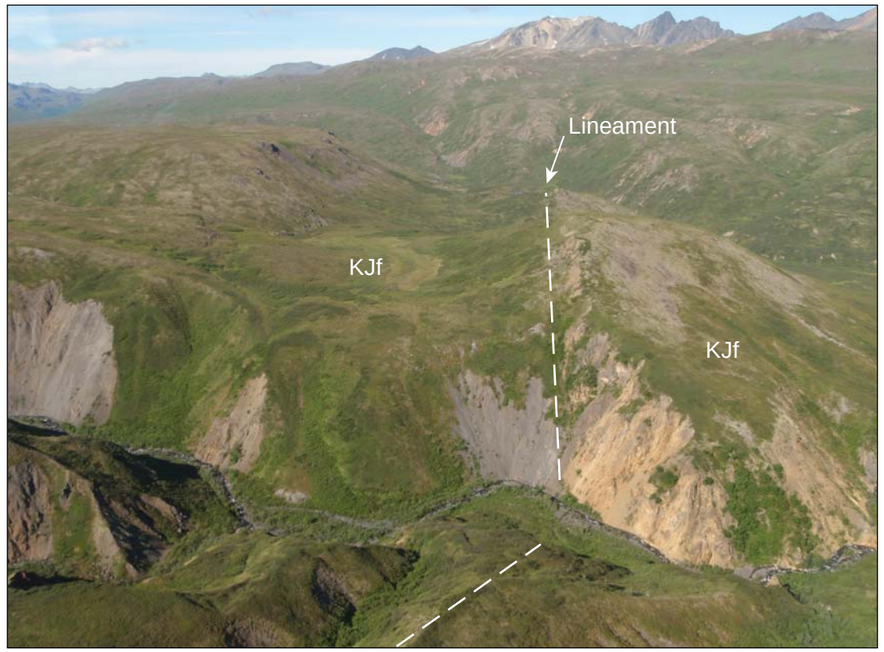
A)

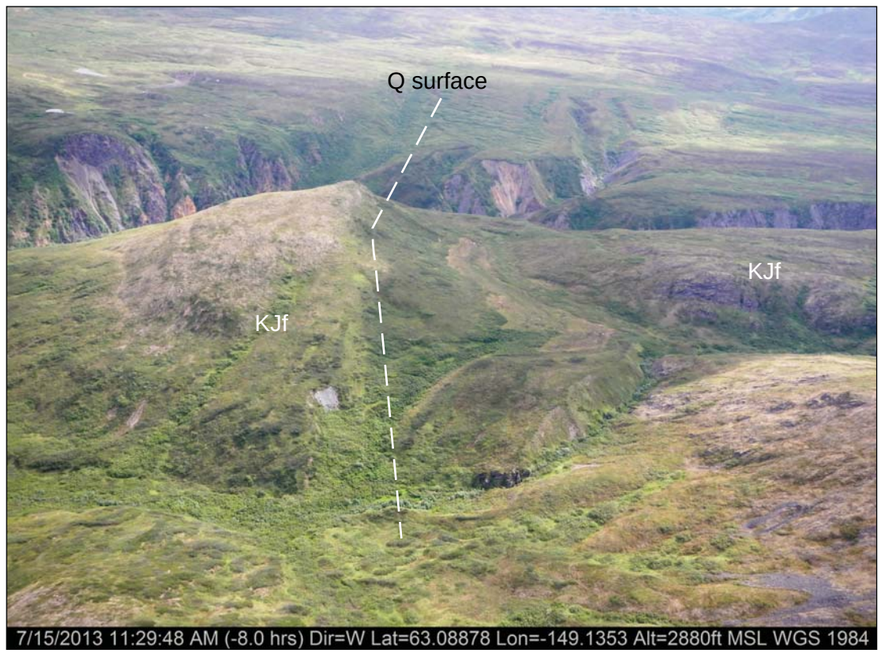
View looking east at likely solifluction-related scarps on hillside that correspond with mapped lineaments. Large arrows point along lineaments.

B)



View looking west along 3a lineament expressed as sharp ridge within Kahlitna flysch (KJf). Apparent color change and topographic expression may suggest a geologic structure, however, none were previously mapped. The feature may be a result of weathering because of lithologic change within the flysch.

C)



View looking east past ridge, with unfaulted Quaternary sediments in the foreground and far distances.

79_218900_Alaska_Railbelt/2189_Lineament Report October 2013, modified 10.18.13

A)

View looking west along oblique to projection of Talkeetna fault

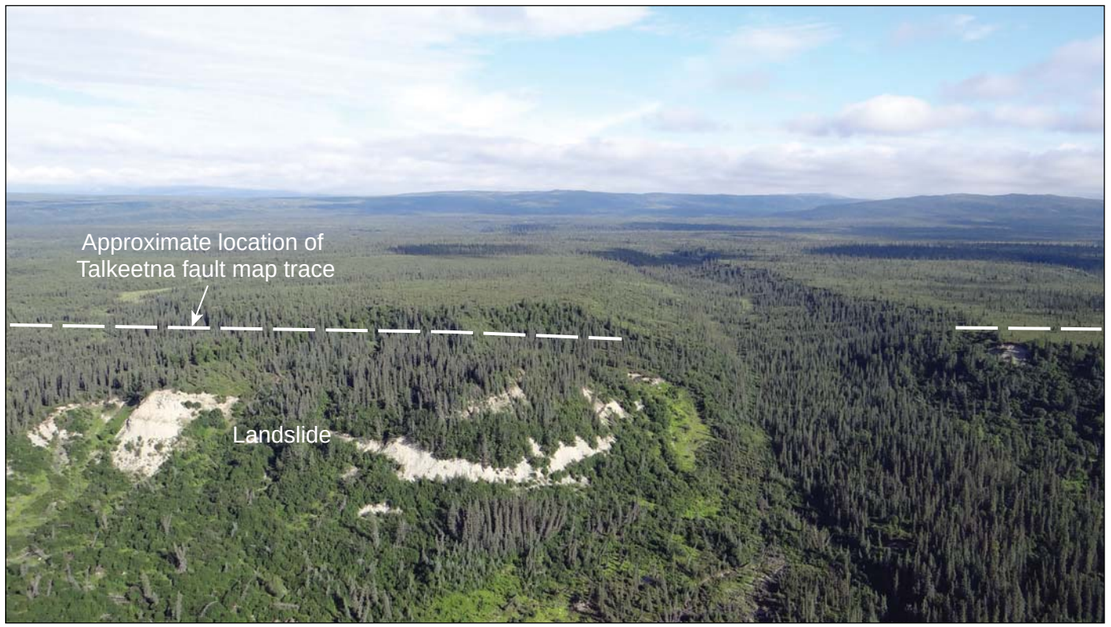
B)

View looking east along lower river bank at apparent alternation zone distinguished by color contrast, possible juxtaposition of Triassic metabasalts and undifferentiated Tertiary sediments. This location is east of the mapped projections of the Talkeetna fault.

C)

View looking east at apparent flat-lying contact between Quaternary lake sediments (above) and Quaternary till (below). Arrows point to contact.

D)



View looking west at projected trace of Talkeetna fault whose ground expression is absent in Quaternary surface.

DRAFT

FUGRO Date 10/18/13	STATE OF ALASKA ALASKA ENERGY AUTHORITY ALASKA ENERGY AUTHORITY	SUSITNA-WATANA HYDROELECTRIC PROJECT LINEAMENT GROUP 6 PHOTOGRAPHS	FIGURE A6.2

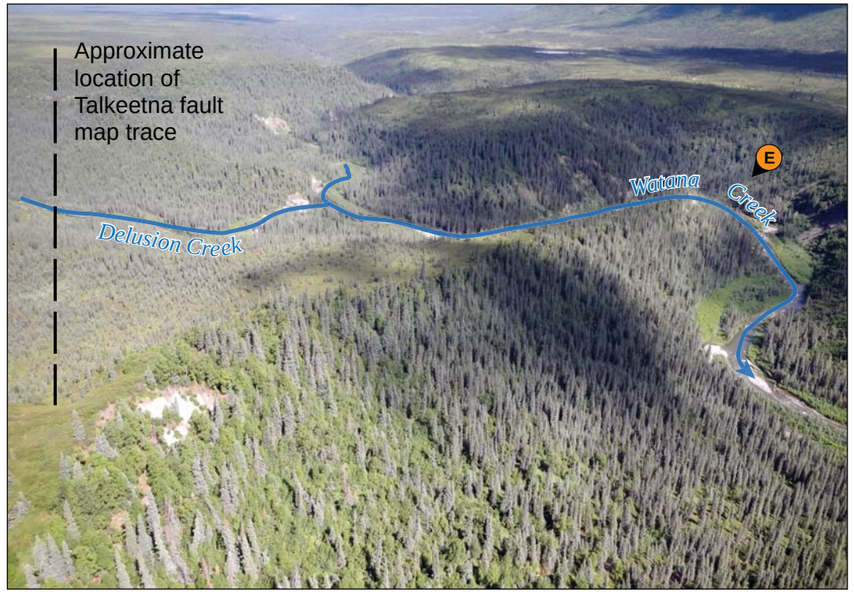
E)

View looking south at erosion-resistant ridge of Tertiary sediments whose beds dip gently to the northwest but appear undisrupted.

F)

View looking west at apparently northwest-dipping beds in Tertiary sediments, relatively consistent with northwest dips measured by WCC (1982) in Tertiary sediments along west bank Watana Creek.

G)



View looking north-northeast past ridge, with flat and apparently undisturbed Quaternary sediments in the background.

H)

View looking west at bedded (lake?) stratigraphy exposed in eroding bluff. Beds appear relatively horizontal, but may have a sense of non-planar geometry because of semi-circular outcrop. Note fallen trees that indicate erosion/slope movement.

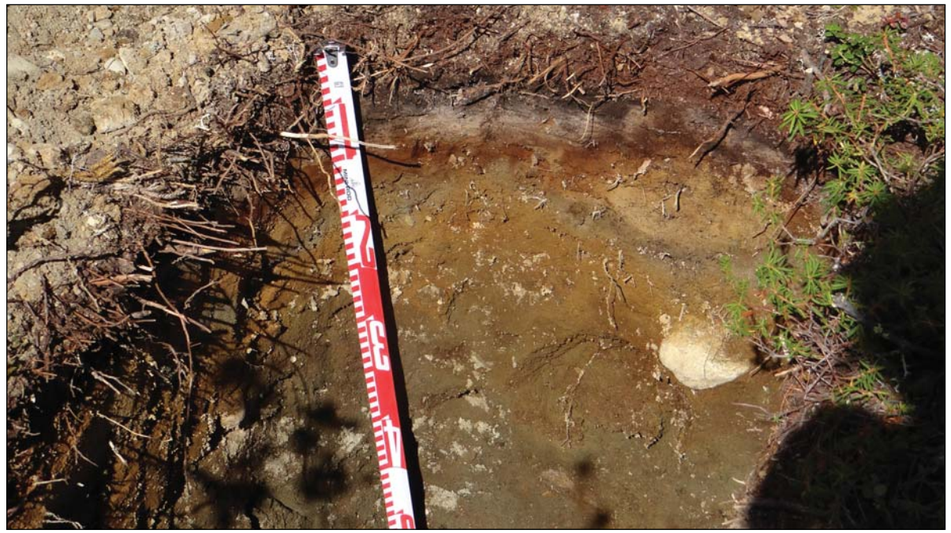
DRAFT

FUGRO Date 10/18/13	STATE OF ALASKA ALASKA ENERGY AUTHORITY ALASKA ENERGY AUTHORITY	SUSITNA-WATANA HYDROELECTRIC PROJECT LINEAMENT GROUP 6 PHOTOGRAPHS	FIGURE A6.3

I)

View looking north at linear esker nearly coincident with map projection of Talkeetna fault.

J)



View looking at shallow soil pit dug in esker crest. Upper black, gray, and reddish soil layers are Holocene tephras. Scale is in centimeters; the upper 45 centimeters of the pit are in view.
